When Air Blasting, the Blast Operator requires that clean, filtered Air suitable for Breathing be supplied to the Blast Helmet.

ABSS supply an Air Purification Kit for the removal of odours and particulate from the Air Supply.

The ABSS Air Purification Kit is NOT designed to remove Carbon Monoxide, Carbon Dioxide or other gases from the Air Supply. Specifically designed alarms and/or converters are required to protect the Blast Operator from these and other dangerous gases.

The ABSS Air Purification Kit is designed for Single Operator use and is supplied mounted in a suitable fabricated frame. A supply Hose and Quick Connect Coupling is supplied for connection to the Blast Helmets Breathing Hose.

The ABSS Air Purification Kit is supplied with the following:
Micro Mist Separator - Nominal Filtration Density - 0.01 microns
Odour Removal Filter - Nominal Filtration Density - 0.01 microns

Never connect a respirator airline hose to an existing air source that has not been tested for gas and particulate contamination.
The presence of unacceptable levels of carbon monoxide (CO) in the Breathing Air will cause death to the operator.

It is recommended NOT to use piston type or oil bath compressors for breathing air. Use of these types of compressors pose an extreme danger of producing unacceptable levels of carbon monoxide (CO) in breathing air which could cause death to the operator.

For all your blast cleaning, abrasive, equipment and parts needs
